Section 000 Strawman Draft v2.0

) Alterations or Repairs. Any activity that-Active Storage. The water volume in the reservoir stored for irrigation, water supply, power generation, flood control, or other purposes but does not include flood surcharge. Active storage is the total reservoir capacity in acre-feet, less the inactive and dead storage. Alterations, Repairs or Either of Them. Only such alterations or repairs as may directly affect the safety or integrity of athe dam. or reservoir, as determined by the Director. Alterations and, repairs dodoes not include routine maintenance items.\_\_ Rule Subsections 055.02.a. and 055.02.b.) Appurtenant Structures.— Appurtenant Structures. Ancillary features (e.g., outlets, tunnels, gates, valves, spillways, auxiliary barriers, etc.)) used for operation of a dam, which are owned by the dam owner or for which the owner has responsible control. ) Artificial barrier or embankment. Any structure constructed to impede, obstruct, or store Borrowed Fill Embankment. Any embankment constructed of borrowed earth materials, and which is designed for construction by conventional earth moving equipment. Certificate of Approval.-Board. The Idaho Water Resource Board. Certificate of Approval. A certificate issued by the Director for all existing dams listing restrictions imposed by the Director, and without which noneno new dams shall be allowed by the owner to impound

Conduit. A pipe or other constructed conveyance within a dam designed to release water or liquid

water. ( )

in the reservoir.

<u>7.</u>	Core. A zone certificate of approval is also required for existing dams before impoundment of rela
	tively low permeability material within an embankment. ( water is authorized. (
	) ( )
	,
8.	<b>Cutoff Trench.</b> An excavation later to be filled with impermeable material during construction of
	eepage beneath the structure and through the foundation.
(10) feet or mo acre-feet or mo at the downstre of the barrier, Section 42-171	Dam. O6. Dam. Any artificial barrier together with appurtenant works, which is or will be ten re in height andor has or will have an impounding capacity at maximum storage elevation of fifty (50) re. Height of a dam is defined as the vertical distance from the natural bed of the stream or watercourse can toe of the barrier, as determined by the Director, or from the lowest elevation of the outside limit if it is not across a stream channel or watercourse, to the maximum water storage elevation. Under 1, Idaho Code, the following are not included as regulated dams or are not considered dams for the entions 42-1710 through 42-1721, Idaho Code:
	Small Dams. Artificial barriers twenty (20) feet or less in height that are capable of storing less than () acre feet of water.
08	Intermediate Dams. Artificial barriers more than twenty (20) feet, but less than forty (40) feet in height
	storing one hundred (100) acre feet or more, but less than four thousand (4,000) acre feet of water.
09.	Large Dams. Artificial barriers forty (40) feet or more in height or are capable of storing four thousand
	or more of water.
10	
<del>10.</del>	Department Jurisdiction. The following are not subject to department jurisdiction:
<del></del>	Artificial barriers constructed in low risk areas as determined by the Director, which are six (6) feet or
less in height, reg	gardless of storage capacity. ( )
b	Artificial barriers constructed in low risk areas as determined by the Director, which impound ten (10)
	at maximum water storage elevation, regardless of height.
<u>a.</u>	Artificial barriers in a canal used to raise or lower water therein or divert water therefrom.
)	Artificial barriers in a canal used to raise of lower water therein of divert water therefrom.
,	
h	d_
<u>U.</u>	Fills or structures determined by the Director to be designed primarily for highway or railroad
traffic.	(
)	
c.	<u>e.</u>
	—Fills, retaining dikes or structures less than twenty (20) feet in height, which are under jurisdiction
of the Departn	nent of Environmental Quality or the Department of Agriculture, determined by the Director to bearily for retention orand treatment of municipal, livestock, or domestic wastes, or sediment and wastes
	washing or food processing plants. (
)	
<u>d</u> .	<b>f.</b>
Section 000	Page_

		Levee means a retaining structure alongside a natural lake which has a length that is two	
		(200) times or more greater than its greatest height measured from the lowest elevation of	the t
		the maximum crest elevation of the retaining structure.	(

Levees, that store water regardless of storage capacity.\_

placed across a channel or entrance to a spillway to temporarily raise the surface level of the reservoir.	
2	
<b>19. Flood.</b> An increase in water surface elevation due to naturally occurring runoff or other rise	<u>ın water</u>
levels that result in the inundation of areas not normally covered by water. As defined herein floods may be ex-	xpressed
in terms of average annual probability of exceedance, corresponding to values which may be described as fl	ow rate,
volume, or elevation (i.e., stage).	(

Section 000 Page

20.	
	Flood Surcharge. A variable volume of water temporarily detained in the upper part of a reservoir,
	r part thereof) that is filled by excess runoff or flood water, above the approved design maximum
storage elevation	on. Flood surcharge cannot be retained either because of physical or administrative factors but is passed
through the res	servoir and discharged downstream by the spillway(s) until the reservoir level has been drawn down
to the design ma	aximum storage elevation. (
)	
21	Excelered Vertical height between the maximum design water surface elevation and the lawset
21.	<b>Freeboard.</b> Vertical height between the maximum design water surface elevation and the lowest
	the top of the dam. Freeboard can include a provision for variables such as wave height, flood surent, and flashboards.
Charge, settlem	ent, and mashoodrds.
2	
<u>22.</u>	
	vironment resulting from the release of water or stored content due to dam failure or mis-operation of
	sive of the size or the physical condition of the dam. Hazard Classifications shall be assigned to new
	ams based on potential adverse incremental impacts in three categories: downstream development, es-
timated loss of	life, and economic losses.
)	
<b>23.</b>	<b>Hydraulics.</b> The study of the conveyance of liquid through pipes and channels. ( )
24.	<b>Hydrology.</b> The study of precipitation, snowmelt, and runoff in relation to land surfaces. ( )
<u> </u>	Trydrology. The study of precipitation, showmen, and funding in relation to fand surfaces.
<u>nflow Design I</u>	
<u>25.</u>	<u></u>
-	Inflow Design Flood (IDF). The flood specified for designing athe dam, or and appurtenant facil-
	v expressed inflow design flood(s) include peak rate(s) of flow and volume(s) associated with floods
	al exceedance probability of 1% (i.e., Q100) and 0.2% (i.e., Q500), and the PMF (probable maximum
flood).	
<u>)facilities.</u>	
<b>26.</b>	Intermediate Dams. Artificial barriers twenty (20) feet or more in height but less than forty (40)
feet or capable	of storing one hundred (100) acre-feet of water or more but less than four thousand (4,000) acre-feet.
)	
27.	Large Dams. Artificial barriers forty (40) feet or more in height or capable of storing four thousand
(4.000) acre-fe	et or more of water. (
)	,
28.	I area A retaining atmentum alamasida a natural lala ruhish has a langth true hundred (200) times
	Levee. A retaining structure alongside a natural lake which has a length two hundred (200) times greatest height measured from the lowest elevation of the toe to the maximum crest elevation of the
_	•
retaining struct	uic. (
<u>29.</u>	Lift Construction. Embankment enlargement by raising the elevation of the structure on a con-
	rring basis. Such practice will be considered under construction until the structure reaches its final crest
elevation.	(

<del>Large</del>	40 ft. or more	<del>or</del>	4000 acre-ft., or more

Risk Category. The following table describes categories of risk used by the Department to classify losses and damages anticipated in down stream areas, that could be attributable to failure of a dam during typical flow conditions.

Risk Category	<del>Dwellings</del>	Economic Losses
Low	No permanent structures for human habitation.	Minor damage to land, crops, agricultural, commercial or industrial facilities, transportation, utilities or other public facilities or values.
Significant	No concentrated urban development, 1 or more- permanent structures for human habitation— which are potentially inundated with flood— water at a depth of 2 ft. or less or at a velocity— of 2 ft. per second or less.	Significant damage to land, crops, agricultural, commercial or industrial facilities, loss of use and/or damage to transportation, utilities or other public facilities or values.
High	Urban development, or any permanent structure for human habitation which are potentially inundated with flood water at a depth of more than 2 ft. or at a velocity of more than 2 ft. persecond.	Major damage to land, crops, agricultural, commercial or industrial facilities, loss of use and/or damage to transportation, utilities or other public facilities or values.

Determination of Size and Risk Category. The Director shall determine the size and risk category of a new or existing dam.

#### 026. -- 029. (RESERVED)

## 030. AUTHORITY OF REPRESENTATIVE (RULE 30).

When plans, drawings, and specifications are filed by another person on behalf of an owner, written evidence of authority to represent the owner shall be filed with the plans, drawings, and specifications.

#### 16. -- 019. (RESERVED)

#### DAM SIZE CLASSIFICATION. **20.**

Size Classification. The following table defines the height and storage capacity limits used by the Department to classify dams regulated for the benefit of public safety:

Dam Size Classification	<u>Height</u>		Storage Capacity
Small Dams and Reservoirs	Ten (10) feet or more but less than twenty (20) feet	and	Fifty (50) acre-feet or more but less than one hundred (100) acre-feet.

Page 8 MWeaver 12102020 Section 000 Section 000

Intermediate Dams and Reservoirs	Twenty (20) feet or more but less than forty (40) feet	<u>or</u>	One hundred (100) acre-feet or more but less than four thousand (4,000) acre-feet.
<u>Large Dams or Reservoirs</u>	Forty (40) feet or more	<u>or</u>	Four thousand (4,000) acre-feet or more.

**Determination of Size.** The Director shall determine the size classification of a new or existing dam.

### 21. -- 024. (RESERVED)

### HAZARD CLASSIFICATION.

Hazard Classification. The following table describes categories of hazard used by the Department to classify dams relative to the potential failure consequences estimated for downstream locations. The listed hazard classifications are meant to serve as guidelines for implementing design, construction, and operation criteria, subject to final interpretation by the Director.

Hazard Classi- fication	<u>Downstream Development</u>	Estimated Loss of Life	Economic Losses
Low	Undeveloped property, no permanent or permanently occupied structures for human habitation.	No loss of life	Low economic losses generally limited to the owner; low damage to or disruption of transportation, utilities, or other public facilities or values including environmental loss.
Significant	No concentrated urban development, 1 or more permanent structures for human habitation within the flood zone that are potentially inundated with flood water at a depth of less than two (2) feet.	Loss of life is unlikely to occur	Moderate damage to agricultural, commercial, or industrial facilities; moderate damage to or the disruption of transportation, utilities, or other public facilities or values including environmental loss.
<u>High</u>	Urban development, or any structure for permanent or temporary human habitation which are potentially inundated with flood water at a depth of two (2) feet or greater.	High probability for loss of life	Severe damage to agricultural, commercial, or industrial facilities; damage to or the prolonged disruption of transportation, utilities, or other public facilities or values including environmental loss.

**Determination of Hazard Classification.** The Director shall determine the hazard classification of a new or existing dam governed by these rules. Hazard classifications shall be assigned to new and existing dams based on the severity of failure consequences exclusive of the size or the physical condition of the dam. The designated hazard classification, as established by the Director, shall determine the applicable design and operational standards applied to the dam..

26. -- 029. (RESERVED)
         FORMS.
             (RESERVED)
        FORMS (RULE 35).
 Forms required by these rules are available from the Department to interested parties upon request.
 Construction of a small dam requires the filing of Form 1710 and construction of an intermediate or large dam requires
 the filing of Form 1712.
 31. -- 034.
                  (RESERVED)
          DESIGN REPORTS, DRAWINGS, AND SPECIFICATIONS.
                (RESERVED)
040. CONSTRUCTION PLANS. DRAWINGS AND SPECIFICATIONS (RULE 40).
 The following provisions shall apply whenin submitting plans, drawings, reports, and specifications for dams to the
 Director for design review and approval, prior to commencing construction.
                                                                                                         01.
                  Submission of Duplicate Plans,
                  Submission of Duplicate Plans, Drawings and Specifications. Any owner desiring who shall desire
 to construct, enlarge, alter, or repair any intermediate or large dam, shall submit duplicate plans, drawings and spec-
 ifications prepared by an engineer for the proposed work to the Director with required fees for approval. The Director
 may, however, require the submittal of plans, drawings and specifications prior to commencing the construction. (-
 of any dam.
              —Applying for and Obtaining Written Approval. Construction of a new dam, or the enlargement,
alteration, or repair of such repairs on existing dams shall not commence be commenced until the owner has applied
for and obtained written approval of the plans, drawings, and specifications from. Alteration or repairs do not include
routine maintenance for which prior approval is not required. (See Rule Subsections 055.02.a and 055.02.b)(
                  Plans Shall Be Prepared on a Good Quality Vellum or Mylar. Transparent copies reproducible
 by standard duplicating processes, if accurate, legible and permanent, will be accepted. Plans may initially be submit
 ted in the form of nonreproducible paper prints. After reviewing the plans, the Director.
                                                                                                         (<del>will</del>
 notify the owner of any required changes.
                  -Preparation and Submission of Plans. Plans and drawings shall be of a sufficient scale with an
 adequate number of views showing proper dimensions, so that the plans and drawings may be readily interpreted and
 so that the structure and appurtenances can be built in conformance with the approved design. Plans and drawings
 shall be submitted in both printed and digital format, with the printed version consisting of paper size 11 x 17 inches.
 After reviewing the plans, the Director will notify the owner of any required changes,
                 (plans and drawings.
                  Information Included with Plans.
                  Information Included with Plans. Plans for new dams or the shall include the following

	NEW DAMS AND RESERVOIRS.  EW INTERMEDIATE OR LARGE DAMS (RULE 50).	
	owing minimum criteria shall be used by the Director as a basis to evaluate the design	n of new embankmen
mediate o	or large earthfill dams and reservoirs in Idaho. These guidelines standards are intend	led <del>-to serve as guid</del>
	ad range of circumstances, and engineers should not consider them as a restriction ting design principles. Exclusion from thesethis established criteria will be considered by	
	pasis during design review of in approving plans, drawings, reports, and specification	
prior to c	commencing construction. Structures which are or will beand evaluating dams. De	ams constructed of
	s, for example concrete, timber, steel, or combinations thereof shall comply with	
annronria	by the Director.	standards of care
	ate by the Director, and with other engineering design methods and construction	

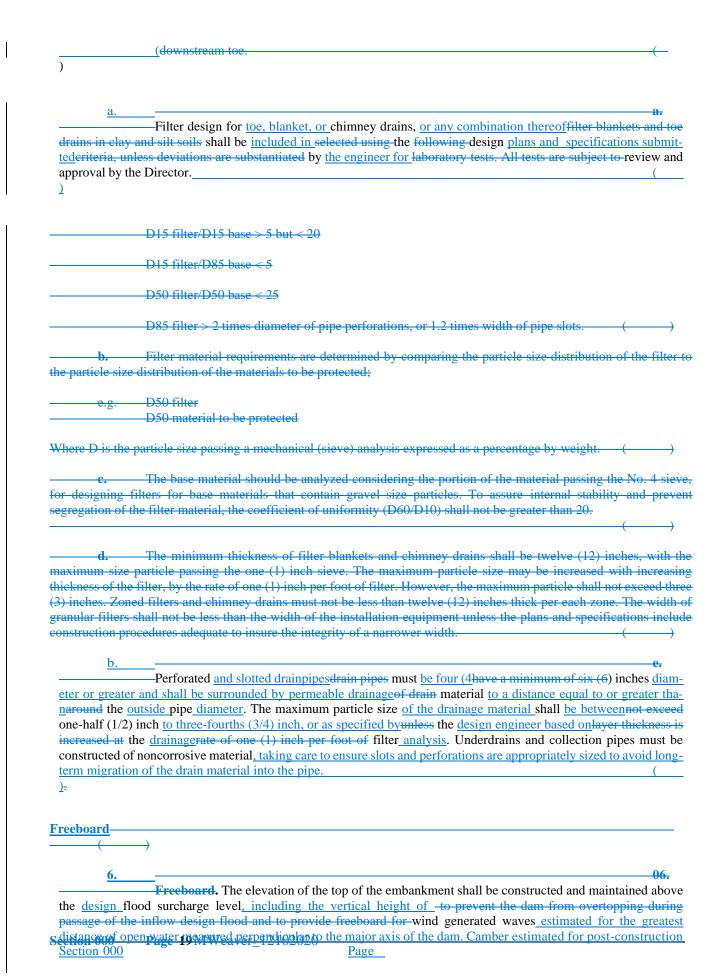

slopes of earthen dams shall comply with the followingbe: Upstream slope 3:1 or flatter 2.5:1 or flatter Downstream slope Embankments-For large high and significant hazard dams and intermediate high hazard dams the embankment shall be designed, constructed, and maintained to assure stability under static loads and prevent instability due to seepage or uplift forces, rapid drawdown conditions, and applied seismic loads. (or drawdown conditions. Transmission of seepage through the embankment, abutments and foundation shall be controlled to prevent internal removal of material and instability where seepage erodes or emerges The design analysis shall consider the need for installing filters, including but not limited to chimney drains, blanket drains, filter fabric and/or toe drains, to avoid developing saturated conditions stabilize the fill and to protect against piping of the embankment fill material. Transmission of seepage through the embankment, abutments, and foundation shall be controlled to prevent internal erosion, the removal of material, or the creation of instability. —The minimum factor of safety for a dam under steady state loading condition shall be 1.5. The During rapid drawdown of the reservoir, the minimum factor of safety for rapid drawdown loadingthe embankment shall be 1.2. The For dams constructed in Seismic Zone 3, the minimum factor of safety forunder seismic loadingload shall be 1.0. Seismic Stability. The stability of an embankment subjected to earthquake ground motions mayean be analyzed by the engineer using either a dynamic response or pseudo-static analyses. Pseudo-static analyses are acceptable for embankment dams and foundations composed of non-liquifiable constructed of soils that preclude the generation of will not build up excess pore water pressures due to shaking. Otherwise,, nor sustain more than fifteen percent (15%) strength loss during earthquake events, otherwise the stability analysis of an embankment dam shall employ be analyzed by a dynamic response method. (<del>A</del> pseudo static analysis simplifies the structural analysis (i.e. the resultant force of the seismic occurrence is represented by a static horizontal force applied to the critical section to derive the factor of safety against sliding along an assumed shear surface). The value of the horizontal force used in the pseudo-static analysis, is the product of the seismic coefficient and the weight of the assumed sliding mass. Slope deformation analyses are required for structures dams located in Seismic Zone 3, that are

settlement. Camber shall be included in the design and incorporated in the construction of the top of the embankment
(, unless waived by the Director. Camber may be estimated by multiplying the structural height of the dam by five percent (5%).
)
The minimuma.The height of wind generated waves (H) moving across a surcharged reservoir can be estimated \text{\text{\text{t}}}
the following equation:
H = 1.95 (F1/2) where F = fetch, the distance in miles across the reservoir, measured perpendicular to the maj
axis of the dam. ( )
a. ————————————————————————————————————
For large, high risk dams the minimum freeboard shall be two (2) feet plus wave height as calculated
for the design spillway flow capacity during passage of the one percent (1%) flood, or equal to the surcharge elevation
of the reservoir during passage of the inflow design flood whichever is greater. (
Riprap e. Estimation of the height of the wind generated wave using the empirical equation in Rule 050.06.
shall not preclude a more conservative design including consideration of fill materials, embankment zoning, slope surface
protection, drainage or other safety factors. ( )
<b>07.</b> Riprap. All embankmentsdams which are subject to erosion on either the upstream and downstrea
slope(s) shall be protected using from wave action. The design engineer, with approval of the Director, shall determine
whether or not rock riprap or other approved material. Pipesprotection is necessary.
a. Where rock riprap is used, it shall be placed on a granular bedding material, and extend up the slop
from three (3) feet below the normal minimum operating level to the top of the dam. ( )
<u>7.                                     </u>
Where riprap is required by Rule Subsection 055.07, pipes, cables, brush, tree growth, dead growth, logs, or floating debris are not acceptable substitutes for approved riprap. The engineer, with approval of the Director.
shall determine the extent of slope protection as deemed necessary for existing site, seasonal, and operating conditions.
riprap and granular bedding material. (rock
)
a. Where rock riprap or other approved material is used for erosion protection on the upstream slope.
it shall be placed on an approved thickness of well-graded and free-draining granular bedding material. Riprap or other
approved erosion protection material shall extend up the slope a sufficient height. (
8. Outlet Conduits. 98.
Outlet Conduits. All reservoirs impounding water shall have be provided with an outlet conduit of
sufficient capacity to prevent interference with natural streamflow through the reservoir to the injury of downstream
appropriators. unless waived by the Director. In addition to any natural flow releases, the outlet conduit should be of sufficient capacity to pass at the same time, the maximum water requirement of the owner. A larger outlet conduit
may be required to provide adequate release <u>capacity</u> as determined by the Director. <u>Upon recommendation</u>
of the design engineer, the Director may waive this requirement for off channel reservoirs.
)
a. a.
Outlet conduits shall be laid on a firm and, stable foundation material to avoid the likelihood
ofand normally not be placed on fills which can consolidate, allow differential settlement or consolidation causing Section 909 Page 20 MWeaver 12102020
